

Atlantic Stories

JONAS

EU Atlantic Member States

Overview

Increasing anthropogenic pressures on the ocean and the resulting underwater noise represent one of the most significant threats to marine biodiversity conservation. Marine activities (shipping, offshore surveys, infrastructure

construction. offshore renewable development energy generation, naval sonar and research activities etc.) produce noise in the marine environment, varying in intensity and frequency, which can adversely affect the biology and ecology of marine organisms.

JONAS aims to address the risks of acoustic pressures on marine biodiversity focusing on sensitive species in the North Atlantic. The project brings together nine research partners from Ireland, UK, France, Spain, and Portugal, with the purpose of addressing the transboundary issues of underwater noise through better risk management and monitoring. JONAS is organised into eight work packages (focused on specific project elements), which address real-time noise management at a local level in sensitive areas, and support policy-makers in developing regional approaches that address biodiversity needs. Partner countries bring national expertise to be exchanged through joint actions and transnational dialogue.

- Improved risk assessment through production of monthly noise and risk atlases based on spatial modelling of noise characteristics and the distribution statistics of key bio-indicators for vulnerable species;
- Production of five case studies on the impacts of acoustic pollution and virtual research environment, a communal work space designed to render often complex technical material into accessible and user-friendly tools and services;
- Improved monitoring and risk management of underwater noise in the Northeast Atlantic region;
- **Support of European nations in meeting MSFD requirements.**

Project in figures

Total cost: € 2.800.404 **EU funding:** € 2.100.303
